A magic square is a 3×3 grid where every row, column, and diagonal sum to the same number. How many magic squares are there using each the numbers 1 to 9 exactly once?

Prove there are no other possibilities.

I've posted a solution in a video.

## **Answer To: How Many 3×3 Magic Squares Are There?**

There are 8 ways to make a 3×3 magic square.

In fact, there is really only one pattern. Every other pattern is a rotation or reflection. From the upper left, the first square on the right is a reflection through the center (transposes columns 1 and 3), for example.

Now let's prove these are the only possibilities.

We use cookies to ensure that we give you the best experience on our website. If you continue to use this site we will assume that you are happy with it.

Yes Privacy Policy

The proof proceeds in 5 steps.

### **Step 1: The magic sum is 15**

By definition, every row, column, and diagonal has the same sum  $M$ .

Thus each of first row, second row, and third row has a sum of  $M$ . So the first 3 rows sum to  $3M$ .

On the other hand, if we sum up all 9 elements, we must have the sum of the numbers 1 to 9

We use cookies to ensure that we give you the best experience on our website. If you continue to use this site we will assume that you are happy with it.

Yes Privacy Policy

If a magic square exists, then each row, column and diagonal has to be 15.

## Step 2: Combinations that sum to 15

Suppose you use the numbers 1 and 2.

$$1 + 2 = 3$$

You would need 12 in order to make 15. This is not possible since we are using the numbers 1 to 9. So we can't combine 1 and 2 to make 15.

Since 9 is the largest number, we have  $1 + 9 = 10$ , which means our other number has to be 5.

$$1 + 5 + 9 = 15$$

Then the next largest number is 8, so we can have:

$$1 + 6 + 8 = 15$$

We can't make a sum with 7, since we would need two 7's to make that possible:

$$1 + 7 + 7 = 15$$

We can go through this exercise and find there are only 8 ways to get to 15.

We use cookies to ensure that we give you the best experience on our website. If you continue to use this site we will assume that you are happy with it.

Yes Privacy Policy

### **Step 3: the center square is 5**

The center square is involved in the middle row, the middle column, and both diagonals.

Which number is involved in 4 sums of 15? There is only one! This is the number 5.

We use cookies to ensure that we give you the best experience on our website. If you continue to use this site we will assume that you are happy with it.

[Yes](#) [Privacy Policy](#)

**Step 4: the corners are even; the edges are odd (1, 3, 5, 7)**

Similarly, each corner square is involved in a row, a column, and a diagonal sum. The only numbers involved in 3 sums are even numbers.

We use cookies to ensure that we give you the best experience on our website. If you continue to use this site we will assume that you are happy with it.

[Yes](#) [Privacy Policy](#)

By the same logic, the edge squares could be the odd numbers 1, 3, 5, and 7.

We use cookies to ensure that we give you the best experience on our website. If you continue to use this site we will assume that you are happy with it.

[Yes](#) [Privacy Policy](#)

### **Step 5: enumerating the 8 possibilities**

The number 1 can go in any of the 4 edges.

We use cookies to ensure that we give you the best experience on our website. If you continue to use this site we will assume that you are happy with it.

[Yes](#) [Privacy Policy](#)

**Step 5: There are 8 ways to put odd numbers on edges.**

	1	
	5	

	5	
	1	

1	5	

	5	1

Can put 1 in 4 spots.

The number 9 will be forced to be opposite.

The number 3 must go in the perpendicular row to the left or right side of the 1, or in the perpendicular column to above or below the 1.

**Step 5: There are 8 ways to put odd numbers on edges.**

	1	
3	5	7
	9	

	1	
7	5	3
	9	

	9	
3	5	7
	1	

	9	
7	5	3
	1	

	3	
1	5	9
	7	

	3	
9	5	1
	7	

	7	
1	5	9
	3	

	7	
9	5	1
	3	

Can put 1 in 4 spots. Can put 3 in 2 spots. So  $4 \times 2 = 8$  possibilities.

In all there are  $4 \times 2 = 8$  possibilities. Since each odd number is involved in two sums, the remaining numbers are forced by these choices.

**There are 8 possibilities. They are reflections/rotations of 1 pattern.**

8	1	6	6	1	8	4	9	2	2	9	4
3	5	7	7	5	3	3	5	7	7	5	3
4	9	2	2	9	4	8	1	6	6	1	8

8	3	4	4	3	8	6	7	2	2	7	6
1	5	9	9	5	1	1	5	9	9	5	1
6	7	2	2	7	6	8	3	4	4	3	8

If you look at the first square, the other 7 squares are rotations or reflections. (you can see an animation of this idea in [my video](#)).

So there is 1 unique magic square. The eight patterns are rotations and reflections that correspond to symmetries of a square (the dihedral group of order 8).

It's a pretty neat proof, and we didn't have to test all  $9! = 362880$  possible ways to place the numbers in the square.

pay.)

By way of history, I started the Mind Your Decisions blog back in 2007 to share a bit of math, personal finance, personal thoughts, and game theory. It's been quite a journey! I thank everyone that has shared my work, and I am very grateful for coverage in the press, including the Shorty Awards, The Telegraph, Freakonomics, and many other popular outlets.

I studied Economics and Mathematics at Stanford University.

People often ask how I make the videos. Like many YouTubers I use popular software to prepare my videos. You can search for animation software tutorials on YouTube to learn how to make videos. Be prepared--animation is time consuming and software can be expensive!

Feel free to send me an email [presh@mindyourdecisions.com](mailto:presh@mindyourdecisions.com). I get so many emails that I may not reply, but I save all suggestions for puzzles/video topics.
